

1 (P413 1.(1)). 用外点法求解下列问题:

$$\begin{cases} \min & x_1^2 + x_2^2 \\ \text{s. t.} & x_2 = 1 \end{cases}$$

Answer. $F(x, \sigma) = x_1^2 + x_2^2 + \sigma(x_2 - 1)^2$

$$\partial_{x_1} F = 2x_1$$

$$\partial_{x_2} F = 2x_2 + 2\sigma(x_2 - 1)$$

令 $\partial_{x_1} F = \partial_{x_2} F = 0$, 解得 $x_1 = 0, x_2 = \frac{\sigma}{\sigma+1}$, 当 $\sigma \rightarrow +\infty$ 时, $\bar{x} = (0, 1)^t, f^* = 1$.

2 (P413 1.(2)). 用外点法求解下列问题:

$$\begin{cases} \min & x_1^2 + x_2^2 \\ \text{s. t.} & x_1 + x_2 - 1 = 0 \end{cases}$$

Answer. $F(x, \sigma) = x_1^2 + x_2^2 + \sigma(x_1 + x_2 - 1)^2$

$$\partial_{x_1} F = 2x_1 + 2\sigma(x_1 + x_2 - 1)$$

$$\partial_{x_2} F = 2x_2 + 2\sigma(x_1 + x_2 - 1)$$

令 $\partial_{x_1} F = \partial_{x_2} F = 0$, 解得 $x_1 = x_2 = \frac{\sigma}{2\sigma+1}$, 当 $\sigma \rightarrow +\infty$ 时, $\bar{x} = (\frac{1}{2}, \frac{1}{2})^t, f^* = \frac{1}{2}$.

3 (P413 1.(3)). 用外点法求解下列问题:

$$\begin{cases} \min & -x_1 - x_2 \\ \text{s. t.} & 1 - x_1^2 - x_2^2 = 0 \end{cases}$$

Answer. $F(x, \sigma) = -x_1 - x_2 + \sigma(1 - x_1^2 - x_2^2)^2$

$$\partial_{x_1} F = -1 - 2\sigma(1 - x_1^2 - x_2^2)2x_1$$

$$\partial_{x_2} F = -1 - 2\sigma(1 - x_1^2 - x_2^2)2x_2$$

令 $\partial_{x_1} F = \partial_{x_2} F = 0$, 解得 $x_1 = x_2, x_1(2x_1^2 - 1) = \frac{1}{4\sigma}$, 当 $\sigma \rightarrow +\infty$ 时, $\bar{x} = (\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}})^t, f^* = -\frac{1}{\sqrt{2}}$.

4 (P413 1.(4)). 用外点法求解下列问题:

$$\begin{cases} \min & x_1^2 + x_2^2 \\ \text{s. t.} & 2x_1 + x_2 - 2 \leq 0 \\ & x_2 \geq 1 \end{cases}$$

Answer. $F(x, \sigma) = x_1^2 + x_2^2 + \sigma (\max(0, 2x_1 + x_2 - 2)^2 + \max(0, 1 - x_2)^2)$

$$\partial_{x_1} F = 2x_1 + 4\sigma \max(0, 2x_1 + x_2 - 2)$$

$$\partial_{x_2} F = 2x_2 + 2\sigma \max(0, 2x_1 + x_2 - 2) - 2\sigma \max(0, 1 - x_2)$$

令 $\partial_{x_1} F = \partial_{x_2} F = 0$, 当 $\sigma \rightarrow +\infty$ 时, $\bar{x} = (0, 1)^t$, $f^* = 1$.

5 (P413 2). 考虑下列非线性规划问题:

$$\begin{cases} \min & x_1^3 + x_2^3 \\ \text{s. t.} & x_1 + x_2 = 1 \end{cases}$$

(1) 求问题的最优解

(2) 定义罚函数

$$F(x, \sigma) = x_1^3 + x_2^3 + \sigma(x_1 + x_2 - 1)^2$$

讨论能否通过求解无约束问题

$$\min F(x, \sigma)$$

来获得原来约束问题的最优解? 为什么?

Answer. (1) 将 $x_2 = 1 - x_1$ 代入目标函数, 化成无约束问题:

$$\min f(x_1) = 3x_1^2 - 3x_1 + 1$$

令 $f'(x_1) = 6x_1 - 3 = 0$, 得到 $x_1 = x_2 = \frac{1}{2}$, 即 $\bar{x} = (\frac{1}{2}, \frac{1}{2})^t$, $f^* = \frac{1}{4}$.

(2) 不能通过解 $\min F(x, \sigma)$ 来获得约束问题的最优解, 因为不满足所有无约束问题最优解含于紧集的条件.

6. 考虑约束优化问题 (P1)

$$\begin{cases} \min & -x_1 x_2 x_3 \\ \text{s. t.} & x_1 + 2x_2 + 3x_3 = 90 \end{cases}$$

(1) 定义外罚函数为

$$G(x, c) = -x_1 x_2 x_3 + \frac{c}{2}(x_1 + 2x_2 + 3x_3 - 90)^2$$

试用外罚函数法求解 (P1)

(2) 利用最优性条件判断 (1) 中得到的极限点是否是 (P1) 的局部最优解?

Answer. (1) $G(x, c) = -x_1x_2x_3 + \frac{c}{2}(x_1 + 2x_2 + 3x_3 - 90)^2$

$$\partial_{x_1} G = -x_2x_3 + c(x_1 + 2x_2 + 3x_3 - 90)$$

$$\partial_{x_2} G = -x_1x_3 + 2c(x_1 + 2x_2 + 3x_3 - 90)$$

$$\partial_{x_3} G = -x_1x_2 + 3c(x_1 + 2x_2 + 3x_3 - 90)$$

解得 $x_1 = 9c - \sqrt{81c^2 - 540c}$, $x_2 = \frac{9c - \sqrt{81c^2 - 540c}}{2}$, $x_3 = \frac{9c - \sqrt{81c^2 - 540c}}{3}$. 令 $c \rightarrow +\infty$, 则 $\bar{x} = (30, 15, 10)^t$, $f^* = -4500$.

(2) 由 KKT 条件

$$x_1 + 2x_2 + 3x_3 = 90$$

$$-x_2x_3 + \mu = 0$$

$$-x_1x_3 + \mu = 0$$

$$-x_1x_2 + \mu = 0$$

可得, (1) 中的点 $\bar{x} = (30, 15, 10)^t$ 是局部最优解.
